

Minth — white-label stablecoin infrastructure for enterprises

The Problem

A mid-sized exporter moving €40M a year across borders loses 1.8% to correspondent banking fees and waits two to five days for settlement. Treasury teams hold idle balances in six currencies to absorb that delay.

Stablecoins solve the settlement problem technically, but an enterprise that wants to use them faces a year of work: custody, compliance, minting and redemption rails, audit trails, and a licensing question nobody in the finance team can answer.

Our Solution

Minth lets a company issue its own branded stablecoin in about ten days instead of twelve months.

We provide the token contracts, reserve management, attestation reporting, and the minting and redemption API. The customer keeps their brand and their treasury policy; we operate everything underneath. Reserves sit with a regulated custodian and are attested monthly by an independent firm.

A client integrating with us writes against a REST API that looks like any payments API. They never touch a blockchain primitive.

The Market

Cross-border B2B payments move roughly \$40 trillion a year. Stablecoin settlement volume passed \$3 trillion in the last twelve months, but almost all of it is crypto-native. The enterprise segment is essentially untouched.

We address mid-market and large enterprises with recurring cross-border flows above \$20M a year — around 40,000 companies in Europe and North America.

Competition

Two categories. Crypto-native issuers sell their own token and ask enterprises to adopt someone else's brand and reserve policy. Traditional payment processors move fiat faster but cannot escape correspondent banking.

Nobody is offering the enterprise its own instrument with compliance handled. That gap is where we sit, and it exists because it requires both regulatory work and infrastructure work, which rarely live in the same company.

The Team

Priya Raghunathan spent eight years building payment infrastructure at a European acquirer, latterly running the team responsible for settlement across nineteen countries. Marek Sobol was head of compliance engineering at a licensed e-money institution and took two products through regulatory approval.

Fourteen people, five of them in compliance and operations — this business is not only software.

Neither of us has founded a company before, and neither has issued a regulated instrument. We have hired an external counsel on retainer for the licensing work rather than pretend otherwise.

Traction

- 9 enterprise clients live, 4 more in integration
- \$2.1B settled in the last twelve months, up from \$310M the year before
- average client goes live in 11 days against a 90-day target at launch
- zero reserve shortfalls across 14 monthly attestations
- net revenue retention of 164%

Business Model

Three basis points on settled volume, plus a platform fee of \$4,000 per month per client. At current volume that is \$7.1M annualised, with gross margin of 71% after custody and attestation costs.

The model improves with client size: our marginal cost per transaction is nearly flat, so a client doubling volume roughly doubles contribution.

Go-To-Market

Direct sales to treasury and finance leadership, with a nine-week average cycle. Two custodian partners refer clients, which now accounts for a third of the pipeline at half the acquisition cost.

Funding

We are raising \$24M to obtain licences in two additional jurisdictions, expand the compliance team, and build the treasury dashboard that clients keep asking for.
