

Tenura — operations software for regulated residential portfolios

The Problem

A property manager running 4,000 regulated residential units in France or Germany spends most of their week on compliance rather than on property. Rent caps, indexation rules, energy performance obligations and tenant notification requirements change by jurisdiction and by year, and getting one wrong is not a fine — it can invalidate a lease.

The software they use was built for unregulated markets and treats compliance as a document store. The actual rules live in a spreadsheet maintained by whoever has been there longest.

Our Solution

Tenura encodes the rules and applies them to the portfolio.

When indexation opens on a lease, we compute the permitted increase for that unit under that jurisdiction's current rules, generate the compliant notice, and track the notification deadline. When an energy performance obligation approaches, we flag the units affected and the work required before they can be relet.

The rules are versioned. When a jurisdiction changes its cap, we update one definition and every affected lease recalculates, with an audit trail showing what applied when.

The Market

Residential property management software is a €3.1B market in Europe. Our addressable segment is narrower than that headline suggests: we serve regulated residential portfolios between 1,000 and 20,000 units in France, Germany, Austria and the Netherlands, which is roughly 2,800 organisations.

Regulation is what makes the product valuable and what limits where we can sell it. Each new jurisdiction is months of legal work before the first euro.

Competition

The large property management platforms are strong on accounting and weak on regulation, which they treat as a local configuration problem. Local incumbents in each market understand the rules but sell software that looks like 2009.

Our position is narrow by design. We are not trying to replace the accounting system; we integrate with it.

The Team

Johanna Ritter spent seven years in asset management at a residential REIT, latterly responsible for a 12,000-unit German portfolio through two regulatory changes. Bastien Cordier was engineering lead at a European lease accounting company.

Neither has a legal background, which is why we retain two housing law firms on an ongoing basis rather than pretending we can track this ourselves.

Twenty-six people, four of them full-time on rule maintenance.

Traction

- 34 customers covering 91,000 units
- €3.9M annual recurring revenue, growing 5% month over month
- gross retention 97%, no customer lost in two years
- average of 11 months from first contact to signature
- four jurisdictions live, a fifth in legal review

Business Model

€3.60 per unit per month, billed annually, with a floor. Average contract value is €115,000. Gross margin is 71% after rule maintenance, which is a real and permanent cost rather than a one-time build.

Retention is the strength here: once a portfolio's compliance runs through us, leaving means rebuilding the rule set. That is also why our sales cycle is eleven months.

Go-To-Market

Direct enterprise sales, supported by presence at property management industry associations. Acquisition cost is €31,000 per customer, recovered in 14 months — long, but against 97% retention.

Funding

We are raising €14M to open two additional jurisdictions, build the energy performance module that three customers have asked for, and grow a sales team that cannot currently cover four countries.
