

Nurra — infant nutrition built on a published ingredient list

The Problem

A parent choosing infant formula is asked to trust a label that does not say where anything comes from. The four manufacturers holding most of the shelf publish a nutrition panel and nothing else: no origin, no supplier, no batch record. When a recall happens, and one happens every few years, the parent discovers at the same time as the retailer that the tin they have been using for six months came from a plant they had never heard of.

Trust in this category is not a marketing preference. It is the entire purchasing decision, and it is currently delegated to a label.

Our Solution

Nurra is a subscription infant formula with a batch-level record published for every tin.

Scan the code on the base and you get the mill that supplied the lactose, the dairy that supplied the protein, the date the batch was blended, and the third-party lab results for that specific batch — not for the product line. We publish the failures too: two batches were withheld in the last year and both are listed with the reason.

The formula itself meets the same regulatory standard as every competitor, because that standard is not optional. What differs is that a parent can check it.

The Market

Infant formula in Western Europe and North America is roughly \$14B at retail, growing 4% a year, and structurally attractive: the customer is acquired once, consumes predictably for eleven to eighteen months, and does not switch brands mid-stage without a reason.

Direct-to-consumer holds around 9% of that, up from 3% five years ago. Our addressable slice is the roughly 22% of parents who report checking ingredient sourcing before purchase.

Competition

Four incumbents hold approximately 81% of retail. Two D2C challengers have launched in the last three years, both positioned on organic sourcing rather than on batch traceability.

We do not claim the formula is better. We claim the disclosure is, and disclosure is copyable — an incumbent

could publish batch records tomorrow. Our defence is that they have not, in forty years, and that their supply chains are not built to make it easy.

The Team

Ines Vogel spent nine years in infant nutrition product development at a European manufacturer, including four years running formulation. Tomas Lindqvist built and ran the supply chain for a D2C consumables brand from launch to €40M in revenue.

Eighteen people. Two food scientists, four in supply chain, the rest in operations and support.

Traction

- 11,400 active subscriptions, up from 4,600 a year ago
- monthly revenue of \$612,000
- 88% of subscribers still active at month six, 71% at month twelve
- churn concentrated at the stage transition, as expected in this category

Retention is the number we watch and it holds. A parent who reaches month six has almost always stayed.

Business Model

\$54 per tin, an average of 5.4 tins per subscriber per month across stages.

Gross margin is 31%. Ingredient cost is the floor and we do not control it: dairy protein pricing moved 19% against us last year and we did not pass it through, because a price increase at month three is the most reliable way to lose a subscriber.

Blended acquisition cost is \$186, which we recover in month eleven on current margin. That payback is longer than we would like and it is the constraint on how fast we can spend.

Go-To-Market

Paid social, midwife and paediatric referral programmes in four cities, and a referral credit that now drives 21% of new subscriptions at no acquisition cost.

Funding

We are raising \$18M to secure a second blending facility, move two ingredients to contracted supply, and take gross margin from 31% to the low forties. The margin is the thesis. Everything else already works.
