

Veyra Health — a full diagnostic clinic in a self-contained pod

The Problem

Primary care in most cities is booked three weeks out. The visit lasts eleven minutes, the physician has your history for four of them, and anything requiring a blood panel means a second appointment at a third location and a wait for results that arrive as a PDF with no explanation attached.

For the patient this is not a healthcare experience. It is a scheduling problem with a stethoscope in it.

Our Solution

Veyra builds self-contained diagnostic pods, installed in retail locations and office lobbies, that a patient enters alone.

Inside, in twenty-two minutes and with no clinician present, the pod performs a 58-marker blood panel from a finger stick, a twelve-lead ECG, spirometry, body composition, blood pressure, retinal imaging and a dermatological scan. Results are interpreted before the patient leaves and presented on screen, with any abnormal finding routed to a physician on our network within the hour.

The hardware is ours end to end: the phlebotomy module, the assay cartridge, the imaging stack and the enclosure. Seven patents granted, nine pending. The blood analysis module alone took four years and brings a laboratory process that normally occupies a bench and a technician down to a sealed cartridge the size of a paperback.

We have five pods in operation. They work. Patients use them unaccompanied and complete the session at a 94% rate.

The Market

Preventive diagnostics in the United States is roughly \$58B. The number of adults who have had no comprehensive blood panel in three years is around 96 million.

Retail health has been attempted by three national chains, all of which built clinics with staff in them. Our unit needs no clinician on site, which changes the economics of placement entirely: a pod fits in 140 square feet and runs sixteen hours a day.

Competition

Retail clinic chains operate staffed sites at a cost structure we do not carry. At-home testing companies ship a kit and return a result in a week with no imaging and no interpretation.

Nothing else performs this panel in one sitting without a clinician. We have looked hard, and the reason nothing else does it is that the hardware is genuinely difficult.

The Team

Dr. Ana Sorescu practised internal medicine for nine years and led clinical development at a diagnostics company through FDA clearance of two assays. Viktor Palme was head of hardware at a medical device manufacturer and shipped three Class II devices.

Sixty-one people, thirty-four in hardware and assay development.

Traction

- five pods operating across three cities
- 11,200 completed sessions
- 94% session completion rate
- 4.7 of 5 average patient rating
- 38% of users return within twelve months

Business Model

Membership at \$149 a month, or \$299 for a single session without membership. 8,400 members today.

Each pod costs \$980,000 to build at current volume, which we expect to bring under \$400,000 at scale. A pod at current utilisation generates around \$71,000 a month.

Reimbursement is not part of our model today. We are a cash-pay service, which keeps us out of payer contracting and lets us set our own price.

Go-To-Market

Site agreements with retail landlords and corporate campuses, with the employer paying for employee memberships in four of our current placements.

Funding

We are raising \$120M to manufacture 200 pods, bring unit cost below \$400,000, and enter eight further cities.
