

Keyhold — enterprise-grade security posture for companies without a security team

The Problem

A 90-person company has the same attackers as a 9,000-person company and none of the defences. It has no security engineer, no detection tooling, and an IT generalist who is also responsible for laptops and the office WiFi. Its cyber insurance policy now asks fourteen questions it cannot honestly answer, and its largest customer has started sending a security questionnaire before renewal.

The tooling that would solve this exists, but it is sold to buyers who have a security team to run it. Handing that console to an IT generalist produces alerts nobody triages, which is worse than nothing because it creates a record of warnings that were ignored.

Our Solution

Keyhold delivers a unified security layer for companies in this position.

We consolidate endpoint, identity and cloud posture into a single managed control plane, apply a hardened baseline configuration, and continuously validate that the environment stays aligned to it. Where the environment drifts, we remediate. Where remediation requires a decision, we escalate to a named analyst rather than to a queue.

The outcome we sell is simple to state: the company reaches and holds a defensible security posture without hiring anyone, and can answer the questionnaire and the insurance form from evidence rather than from memory.

The Market

There are roughly 210,000 companies in North America and Europe in the 50 to 500 employee range with regulated data and no security staff. Cyber insurance requirements and customer security reviews are pushing all of them toward a floor they currently do not meet.

The managed security market is around \$32B and growing 13% a year, but the part of it aimed below the enterprise is thin.

Competition

Managed security providers serve this segment with human-led monitoring at a price point that starts near \$8,000 a month. Endpoint vendors sell tools, not posture. Compliance automation platforms produce evidence for auditors without changing the underlying environment.

We sit between them.

The Team

This is the strongest part of the company and the reason to back it.

Dr. Ravi Menon led incident response at a national cyber agency for six years, where he ran the response to two nationally significant intrusions, and subsequently built the detection engineering function at a Fortune 100 bank. Hanna Bergström spent eight years in offensive security, four of them leading a red team that operated against financial institutions under regulatory supervision, and has published on lateral movement detection at three major conferences. Our third engineer wrote a widely used open-source EDR rule set.

Between the three founders there are twenty-six years of operational security experience against real adversaries, not in a lab. Our first eleven customers were introduced by people who had worked with one of us before.

Nineteen people, fourteen of them technical.

Traction

- 61 customers
- \$2.4M annual recurring revenue
- 6% annual churn
- average contract \$39,000

Business Model

Annual subscription priced per seat, from \$28 to \$41 depending on modules. Gross margin 68%, which reflects the analyst time in the delivery model.

Go-To-Market

Referrals from cyber insurers, who have an obvious interest in their policyholders reaching a floor, and direct outbound to companies that have just failed a customer security review.

Funding

We are raising \$16M to scale delivery and reduce the analyst time per customer.
