

Aloria — a guided wellness programme for people who have tried apps before

The Problem

People who want to improve their sleep, their stress levels or their exercise habits generally know what to do. They download an app, use it for eleven days, and stop. Engagement in consumer wellness apps drops below 5% at ninety days across the category.

The content is not the problem. The follow-through is.

Our Solution

Aloria combines a structured twelve-week programme with a weekly check-in from a human coach.

The programme covers sleep, movement, nutrition and stress, adapted to what the user reports at the start and adjusted as they go. The coach reviews progress once a week and sends a short message — not a session, a message — which is enough contact to change completion rates without carrying the cost of a full coaching model.

Users log activity in the app, which syncs with the usual wearables.

The Market

Consumer wellness applications represent roughly \$11B globally, growing at around 9% a year. Employers are an increasingly common buyer, with wellness benefits now offered by a majority of companies above 500 employees.

Our addressable segment is adults who have previously used and abandoned a wellness app, which is most people who have used one.

Competition

The category is crowded. Several large meditation and fitness apps have far more users and far more content than we do. A handful of coaching-led services charge between \$200 and \$400 a month.

We sit in the middle: more support than an app, less cost than a coach. That position is reasonable and it is not defensible.

The Team

Julia Sandberg worked in product at a consumer health company for five years. Marc Oliveira was a certified health coach and ran a coaching practice before joining.

Fourteen people, four of them coaches.

Traction

- 22,000 registered users, 6,400 paying

- \$1.4M annual recurring revenue
- 42% of users complete the twelve-week programme
- monthly churn 6.2%
- four employer contracts covering 2,100 employees

Completion at 42% is meaningfully above the category, and it is the number we would point to if asked for one.

Business Model

\$29 a month direct, or \$16 per employee per month through employers. Gross margin 61%, held down by coach time. Acquisition cost \$74 against a lifetime value we estimate at \$310.

The economics work at current scale. Whether they hold as we add coaches is untested.

Go-To-Market

Paid social for direct users, and a small outbound effort to HR benefits managers, which produced the four employer contracts over eight months.

Funding

We are raising \$6M to grow the employer channel, which has better retention and lower acquisition cost than direct, and to bring coach cost per user down through better tooling.
