

Halcyon Threat — next-generation adversarial exposure management

The Problem

The threat landscape has fundamentally changed. Nation-state actors, supply chain compromise, living-off-the-land techniques, and now adversarial use of generative models have collapsed the assumptions that enterprise security was built on.

Dwell time averages 204 days. Mean time to detect has barely improved in a decade. The average enterprise runs 76 security tools and correlates almost none of them. Breach costs passed \$4.9M per incident last year and the trajectory is not flattening.

Security leaders know this. What they lack is a way to see their exposure the way an adversary sees it.

Our Solution

Halcyon Threat delivers continuous adversarial exposure management across the enterprise attack surface, unifying signal from existing controls into a single risk-prioritised view aligned to the MITRE ATT&CK; framework.

Our platform operationalises threat intelligence at machine speed, correlating exposure, reachability and adversary behaviour to surface what actually matters. Security teams move from alert triage to exposure reduction.

We are AI-native by design.

The Market

Global security spending will exceed \$260B next year. Exposure management is the fastest-growing segment within it, and analyst coverage now treats it as a distinct category.

The Team

Daniel Aberg spent nine years in security operations, latterly as deputy CISO at a European financial institution. Wren Kosslyn led detection engineering at a managed security provider.

Twenty-three people.

Traction

We are in advanced discussions with several enterprise design partners and expect to announce our first named

customers shortly.

Business Model

Annual platform subscription priced on protected asset count, with tiers for mid-market and enterprise. Indicative annual contract value is \$140,000. Gross margins are expected to be typical for security software.

Funding

We are raising \$18M Series A to accelerate go-to-market and expand the platform.
