

Skipp — micromobility for mid-sized European cities

The Problem

Mid-sized cities have been left behind by micromobility. The big operators went for capitals and left cities of 100,000 to 400,000 people without a service, even though those cities have the same last-mile problem and far less competition.

Our Solution

Skipp deploys shared electric scooters in cities between 100,000 and 400,000 inhabitants. Same model that worked in the capitals, applied where nobody else has bothered to go.

Lower competition means better unit economics: we expect fewer scooters lost to vandalism, less price pressure, and easier relationships with municipalities who are keen to have a service at all.

The Market

There are over 400 European cities in our size band. The global micromobility market has been valued at more than \$50B, and major operators have raised billions and deployed hundreds of thousands of vehicles across the world, which shows the demand is real and proven at scale.

Competition

The large operators are not present in our target cities and have shown no interest in entering them. That is our window.

The Team

Mikkel Sørensen worked in operations at a scooter company for two years. Aurélie Brun has a background in municipal relations.

Six people.

Traction

- one city live since July, 120 scooters
- 4,800 rides completed
- average 1.6 rides per scooter per day

We expect utilisation to improve as awareness grows.

Business Model

€1 unlock plus €0.22 per minute, which is standard for the sector.

Vehicle cost is €480 and our current average vehicle lifetime is seven months. We are working with suppliers on more durable hardware.

Funding

We are raising €4M to enter six more cities.
